

Did you know...?

- ❖ Modern wells provide a safe, efficient water supply to more than 21 million homes nationwide. Today's well owners enjoy the peace of mind that comes with knowing they have a reliable source of water that meets all the demands of modern households.
- ❖ Well water is nature's best. Water from modern wells is naturally filtered and is cool, natural and pure.
- ❖ Well water comes from aquifers – safe, protected natural resources within the earth. Well owners know what their family is drinking when they turn on the tap.
- ❖ A well is like money in the bank. A professionally installed well provides many years of safe, affordable water.
- ❖ Wells are easy to maintain. The pump and other mechanical parts of a well can last for 20 years or more.

A HOMEOWNER'S GUIDE TO

YOUR WELL

Buying a Home with a Well?

Know What Questions to Ask

- **Research the well's history.** Try to get as much information as possible on the construction, maintenance and condition of the well. A copy of the well log or well history may be available through the seller, the company that drilled the well, and/or the local health department.
- **Review the well's condition, including its location and age.** The checklist in this brochure lists the ideal conditions for the well on your new property.
- **Know the well's capacity and yield.** Many communities set minimum well yield levels. Call the local health department or ask a well professional for minimum well yield requirements in the area.
- **Ask if any water treatment devices are installed.** These should also be regularly maintained.
- **Conduct a water test.** At a minimum, every well should be tested annually for bacteria. The U.S. Environmental Protection Agency (EPA) also recommends testing for nitrate/nitrite and pH, and recommends consulting with experts about the need to test for contaminants of local concern, such as arsenic, lead or radon. Buyers should have a drinking water test done as part of a home inspection.
- **If you still have questions about the condition of the well, contact your well professional about further well inspection, water testing and the need for well repair or replacement.** A water well professional can help you schedule further inspection, maintenance and testing to keep your new well system operating at peak capacity. A properly constructed and maintained well can provide 20+ years of safe drinking water for you and your family.

Your Well's Condition: A Checklist

The well log will contain much of the information needed to complete this checklist.

Well Location

- The well is uphill from pollution sources, such as the septic tank and septic field.
- Surface water doesn't reach or is diverted from the well.
- The wellhead is visible and above ground. No landscaping or other structure hides or buries the wellhead.
- The well is at least 100 feet away from potential pollution sources, and meets or exceeds all state minimum requirements for distance.

Well Construction and Maintenance

- The well is less than 20 years old.
- The well is a drilled well.
- The lining of the well (the casing) is 12 or more inches above the land surface. In flood prone areas, the casing is one to two feet above the highest recorded flood level. This ensures that no substances can wash into the well.
- No holes or cracks are visible in the well casing or well cap. The cap is tightly attached and a screened vent faces the ground.
- The casing extends 50 or more feet below the land surface.
- Measures are taken to prevent backflow (reverse flow in water pipes) and, where necessary, anti-backflow devices are installed.
- The well has been regularly inspected and records are available.

Frequently Asked Questions & Answers About Wells

Question: What type of treatment is needed for a well system?

Answer: Well water is naturally better! So it's likely that your well water won't need any treatment. Before you consider treatment, you should have your water tested. The test results will help you decide what (if any) treatment you may need. Then, your water well contractor or a licensed water treatment professional in your area can recommend the best treatment technology for your well.

Question: What type of maintenance is required on a well?

Answer: You should inspect your wellhead several times a year, and have your well system – including the pump, storage tank, pipes and valves, and water flow – inspected every 10 years by a qualified well driller or pump installer. Water testing should be performed annually or more often as necessary. For more information, see the wellcare® information sheets on “Well Maintenance” and “Drinking Water Testing.”

Question: Are there ever times when you have to watch your well water consumption so as not to run your well dry?

Answer: Moderate to severe drought conditions are a fact of life in more than half of the nation. Some utilities and local and state governments have declared mandatory water

conservation measures, even for private well owners. For more information, see the wellcare® information sheets on “Water Conservation,” “What to do if the Well Runs Dry,” and “Ground Water Withdrawals.”

Question: What do I do to prevent a disruption in service due to a power outage?

Answer: Electricity is needed to operate your well pump. You can avoid disruptions of service by planning ahead. Two simple solutions are to include a retention tank in your well system and/or have an alternative power source in times of emergency. For more information, see the wellcare® information sheets on “Wells: What to do When the Power Fails.”
